

Mounting instructions inner door for corner refrigerator/pantry.

Technical specifications

- Place the inner door on the floor in the door opening with the hinges on the same side as the door and with the blue spacer blocks on. Centre it right on the inside of the door frame.
- Mark off holes at the top of the hinges with a pencil
- Drill 4 holes of 2-3 mm where the markings are placed
- Screw and fix the hinges in place with the 4 accompanying screws
- Remove the blue spacer blocks in the bottom and adjust the height so that it is free of the floor
- Finally, adjust the hinge with the aid of the adjuster screw so that it moves freely in the opening and so that it stops just on the inside of the door frame (it may be that it needs to be adjusted a little after it has become cold)

You now have a functional inner door that prevents draught from the cooling room, at the same time
